

CliniqAI Phase Assignments

Dual-Platform Architecture (Mobile Number Driven HIE)

CliniqAI acts as a centralized AI Health Information Exchange (HIE). The patient's mobile number works as the universal identifier across clinics, hospitals, and doctors. The product is split into two coordinated platforms: a write-access provider portal and a read-only patient portal.

Bhavani's Assignment: Clinic / Provider Portal

Objective: Plan the hospital/clinic-facing web UI used by doctors and staff to register patients, fetch cross-clinic records, upload documents, and review AI-generated safety alerts.

- **Provider login and clinic context:** Define the clinic login flow, header identity, and role-aware entry experience for hospitals, clinics, and doctors.
- **Patient lookup by mobile number:** Design the first-step search flow where staff enter a patient's mobile number to fetch their longitudinal record, even if the patient is new to that clinic but already exists in CliniqAI.
- **New patient registration:** Plan the form and workflow for hospitals to register first-time patients on CliniqAI. Patients themselves do not create or edit records.
- **Document upload and extraction workspace:** Define the upload area for prescriptions, reports, X-rays, MRIs, and discharge summaries, including preview, extraction summary, and save-to-record flow.
- **Cross-clinic clinical alert UI:** Plan the high-visibility warning state that surfaces past allergies, duplicate medicines, and risky conflicts based on records from other hospitals or clinics.

Yashaswini's Assignment: Patient Portal

Objective: Plan the patient-facing read-only experience where users can see their complete medical history across clinics without being allowed to modify records.

- **Patient login:** Define the mobile number plus OTP-style access flow for patients.
- **Health timeline:** Design a chronological visit history showing which clinic or hospital the patient visited, which doctor handled the visit, diagnoses, medicines, dosage, and attached reports.
- **Documents and scans view:** Plan the section where patients can view uploaded prescriptions, lab reports, X-rays, MRI files, and AI-generated summaries.
- **Active medications and care summary:** Define a simplified dashboard showing current medicines, dosage, and the originating doctor or clinic for each recommendation.
- **Read-only trust model:** Make it explicit in the UI that patients can view but cannot edit, add, or overwrite records in CliniqAI.
